Polypeptides specifically claimed, include residues 217-297, 216-310, 216-312, 216-352, 216-377, 1-377, 295-297, 117-297, 140-297. DNA sequences encoding the polypeptides are also claimed. Also claimed are a fusion polypolypeptide that contains: (a) a first amino acid residue sequence up to 250 residues in length that includes residues 120-135 of apo A-I, (b) a second amino acid residue sequence up to 375 residues in length that includes 120-135 of apo A-I, (b) a second includes residues 217-297 of apo B-100 and DNA encoding it. (Updated on 25-MAR-2003 to correct PN field.)
                      A dispersible apo A-I/B-100 fusion polypeptide is claimed which contains a first AA sequence of apo A-I (Bee AAR72605) and that includes at least AA sequence positions 120-135 (see AAR72606). The two sequences are operatively linked. An exemplary linking sequence is AAR72707 whose encoding DNA can be ligated between an apo A-I and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polypeptide mimic of native apo B-100 and native apo A-I - useful in assays for LDL and HDL in plasma samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The inventors claim a portion of the polypeptide contg. apo B-100 that immunoreacts with antibodies secreted by the hybridoma MB47

                                                                                                                                                                                       A flexible spacer peptide (AAR95062) is used to link the light chain variable domain to the heavy chain variable domain of a single chain recombinant antibody (scFv). The scFv may be derived from a monoclonal antibody, e.g. MAb FRP5, and forms the ligand domain of a multidomain protein (see also AAR95053 and AAR95056-59) that is used with an effector nucleic acid in a novel nucleic acid transfer system suitable for gene therapy. The ligand domain has a target cel recognition function and allows cellular internalization of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                           (II) a modified human interleukin-3 (hII-3) AA sequence; (III) a modified human c-mpl ligand; and a colony stimulating factor (CSF); and L1 = a linker capable of linking R1 to R2. This sequence represents an example of a linker used to construct the proteins of the invention. Vectors comprising the nucleic acid molecules are useful for the recombinant production of HP. The nucleic acid molecules are useful in gene therapy. The HP's are useful for stimulating the production of haematopoietic cells in patients, selective ex vivo expansion of stem cells and for treatment of haematopoietic disorders. Disorders that can be treated include leukopaenia, neutropaenia, aplastic anaemia and thrombocytopaenia. In vitro uses include the ability to stimulate bone marrow and blood cell activation and growth before infusion into the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel haematopoietic protein (HP) comprising an amino acid (AA) sequence of formula: R1-L1-R2; R2-L1-R1; R1-R2; or R2-R1; where R1 and R2 are independently selected from: (I) a modified human granulocyte-colony stimulating factor (hG-CSF) AA sequence; (II) a modified human interleukin-3 (hIL-3) AA sequence; (III) a modified human interleukin-3 (hIL-3) AA sequence;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bauer SC,

The present sequence represents the preferred pentapeptide linker used to link the MBP moiety and PB moiety in a chimeric protein. The chimeric proteins can be used for the treatment of autoimmune diseases such as multiple sclerosis. The while having no effort mannetally target and kill MBP specific T cells while having no effort mannetally target and kill MBP specific T cells

These compounds are dual avb3 receptor/metastasis-associated receptor ligands, and inhibit angiogenesis and thus proliferation of (cancer) cells. One component binds to the avb3 receptor and the other to a metastasis-associated receptor. The avb3 antagonists may also be conjugated to anti-angiogenic proteins, such as IFN-alpha and its derivatives. The compounds are used to treat angiogenesis-related disorders (mediated by the avb3-integrin), specifically cancer (of lung, breast, ovary, prostate, stomach, colon, kidney or bladder, also melanoma, hepatoma, sarcoma and lymphoma), arthritis and macular degeneration, and also diabetic retinopathy, hemangioma, psoriasis, osteoporosis, thrombosis, angina, atherosclerosis etc. The compounds may also be useful as antiviral, antibacterial and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a novel single-chain molecule (I) that binds multiple antigens and comprises two variable domains of heavy immunoglobulin chains (VH), having specificities A and B and two cariable domains of light chains (VL), also with specificities A and B.

The domains are provided as two VH-VL constructs which are attached via a peptide (P). Any VH and VL may be replaced by their functional crayments. The products of the invention have anticancer, antiviral, antibacterial, antimalarial and antiinflammatory activity. (I) are used to treat, prevent or diagnose tumors (e.g. as tumor vaccines), autoimmune diseases and inflammation (e.g. transplant rejection and arthitis), compared the diseases and inflammation (e.g. transplant rejection and arthitis), compared the diseases and inflammation (e.g. transplant rejection and arthitis), compared the disorders (e.g. of the coagulation and/or circulatory systems, such as anemia, leucopenia, thrombocytopenia and hypertension), nervous system considered and modern and arthitis (e.g. transplant rejection), nervous system including, when (I) include a fusogenic peptide, use for gene transfer. (I) are produced simply and in predominantly homogeneous form, in a wide sequence represents a VH-VL domain linker peptide which is used to cillustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The product of the invention has antiviral, anticancer, immunomodulatory, anti-arthritic and antidiabetic activity. (A) have the antiviral, anticancer and immunomodulating activities of IFN, e.g. for treating hepatitis and other viral infections, hairy cell leukemia, Kaposi's sarcoma, multiple myeloma and other cancers, multiple sclerosis, rheumatoid arthritis, myasthenia gravis, diabetes, acquired immune deficiency syndrome and lupus. When complexed in (A), the storage life of IFN is increased (i.e. it is stabilized against oligomerization, without the need for storage at acidic pH) and its biological effect is
                                                                                                                                                                                                                                                                                                                                                                                          anti-tumor; multifunctional protein; angiogenic-mediated disease; cancer; diabetic retinopathy; macular degeneration.
              The specification describes multifunctional proteins which comprise combinations of angiostatin, endostatin, interferon, thrombospondin, interferon inducible protein and platelet factor 4, and have anti-angiogenic and/or anti-tumor activity. The multifunctional prot

target protein, a second binding domain capable of forming neutralising complex with an induced epitope of the target protein and a linker connecting the binding domains. SCD4-SCFV(17b) comprises a soluble CD4 fragment (containing domains D1 and D2) fused to a single chain Fv portion of antibody 17b via a linker. sCD4-SCFv(17b), its variant, analogue or mimetic is used for inactivating gp120 protein of HIV, and for neutralising HIV. It is also used for blocking and preventing the binding of the viral or recombinant gp120 protein to soluble CD4 or lymphocyte CD4 and for inhibiting HIV replication. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. ANY02125-32 represent peptide linkers used to make the
                                                                                                                                                         sCD4-SCFv(17b) is a neutralising bispecific fusion protein capable binding to two sites of its target protein. The protein comprises a first binding domain capable of binding to an inducing site on the
                                                                                                                                                                                                                                Claim 30; Page 45; 55pp; English.

Gene therapy is used to secrete the bispecific protein at mucosal surfaces, such as the vaginal, rectal or oral mucosa. The fusion proteins is highly potent, broadly cross-reactive with neutralising antibody with high in vivo activity and no PC-mediated undesirable targetting properties. When the fusion protein is substantially derived from human proteins, it has minimal immunogenicity and toxicity in humans which is of great value in prevention of infection during or immediately after HIV exposure.
The invention relates to raising a neutralising antibody response to a broad spectrum of HIV (human immunodeficiency virus) strains and isolates, comprising the administration of a peptide which corresponds to or mimics highly conserved portions of the gp41 envelope glycoprotein which are important in mediating the process of viral entry into host cells. Such peptides can correspond to or mimic the coiled coil solution structure of the N-helical domain (the heptad repeat region), or can correspond or mimic the C-helical domain (the
                                                                                                                                                                                                                                                                                                                                 Raising neutralizing antibody response to human immunodeficiency virus, comprises administering a polypeptide capable of forming a stable coiled-coil solution structure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HIV-1; gp41; N-helical domain; heptad repeat region; C-helical gp41 transmembrane-proximal amphipathic alpha-helical segment; core 6-helix bundle; viral entry inhibition; immunogenic; antibdy; humoral response; broad spectrum vaccine; anti-HIV;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   chimeric proteins is therefore useful for treating HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     08-JAN-1999; 99US-0115404.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC transmembrane-proximal amphipathic alpha-helical segment), or the CC gp41 core 6-helix bundle, which is formed by the interaction of CC the N- and C-helical domains of three gp41 proteins. The peptides CC can be administered either singly or as a combination (particularly CC a combination of N-helical and C-helical peptides), and can be CC multimerised. For example, N- and C-helical peptides), and can be CC alternately linked together to form a peptide which mimics the core CC einvolved in viral entry. As these portions of gp41 are well conserved, CC such antibodies may be effective against a broad range of HIV strains CC and isolates. The peptide compositions of gp41 are well conserved, CC such antibodies may be effective against a broad range of HIV strains CC prophylactic or therapeutic vaccine to generate antibodies which reduce CC or inhibit the ability of HIV to infect uninfected cells. A composition CC reduce HIV infection of uninfected cells. Antibodies raised against centry-relevant gp41 structures may also be used therapeutically and as tools to further elucidate the mechanism of HIV cell entry. The presents a peptide linker which may be used to CC present sequence represents a peptide linker which may be used to
